

digital signal processing using pdf

The most common processing approach in the time or space domain is enhancement of the input signal through a method called filtering. Digital filtering generally consists of some linear transformation of a number of surrounding samples around the current sample of the input or output signal. There are various ways to characterize filters; for example:

The Scientist and Engineer's Guide to Digital Signal

Digital signal processing algorithms typically require a large number of mathematical operations to be performed quickly and repeatedly on a series of data samples. Signals (perhaps from audio or video sensors) are constantly converted from analog to digital, manipulated digitally, and then converted back to analog form.

I've been reading this book to refresh my memory on digital signal processing. It is a good book, lots of theory in there, however it is a bit dry in its explanations, there are a lot of results (for example the value of a certain number series) that just are presented out of the blue while the reader scratches his head trying to come up with the missing steps.

Other recursive filter programs: rffr.c - Calculates the frequency response of a recursive filter using the coefficient file created by one of the above programs. rdf.c - Filters data from an input file, using a coefficient file generated by one of the above programs.. FIR Nonrecursive Digital Filters. A general nonrecursive filter is implemented as follows:

This is an educational blog aimed at helping the reader understand the theory behind digital signal processing blocks used in digital communication transmitter and receiver. The theory is explained using classical text books as reference accompanied with simulation model using Matlab and/or Octave scripts.
