The Role of the Mannose-Binding Lectin in Innate Immunity

The mannose receptor (MR) recognizes a range of carbohydrates present on the surface and cell walls of micro-organisms. The MR is primarily expressed on macrophages and dendritic cells and is ...

Role of the Mannose Receptor in the Immune Response

Overall, MBL is an important host defense molecule that plays a key role in first-line host defense against certain infectious agents. However, it is also likely that the role of MBL extends beyond this restricted infection-related view in that it appears to be a key regulator of inflammation. Acknowledgements. Potential conflicts of interest. All authors: no conflicts.

carinii, exposed mannose groups are not found on the surface of *C. neoformans* because of masking by the capsule (10, 35). Therefore, it is likely that the major role of the MR in defenses against cryptococcosis is recognition of soluble MP released from the fungus.

Role of the Mannose Receptor in a Murine Model of

Mannose-binding lectin (MBL) and MBL-associated serine protease 2 (MASP-2) deficiencies are common primary immunodeficiencies the clinical penetrance of which remains controversial.

pathway, mannose-binding lectin (MBL) and ficolins act as recognition molecules, and MBL-associated serine protease (MASP) is a key enzyme; MASP-2 is responsible for the lectin pathway activation.

wild-type and MR KO mice (15, 34). In addition to its role in pathogen recognition, the MR also functions to clear endogenous proteins bearing accessible mannose residues (14). Thus, the MR appears to play dual roles as a pathogen recognition receptor and as a regulator of glycoprotein homeostasis.

Role of the Mannose Receptor in a Murine Model of

Mannose-binding lectin (MBL) is a pattern recognition molecule of the innate immune system. It belongs to the collectin family of proteins in which lectin (carbohydrate-recognition) domains are found in association with collagenous structures.

The role of mannose-binding lectin in health and disease

The role of mannose-binding lectin (MBL) deficiency (MBL2 ; XA/O and O/O genotypes) in host defences remains controversial. The surfactant proteins (SP)-A1, -A2 and -D, other collectins whose genes are located near MBL2 , are part of the first-line lung defence against infection.

The entry of ricin toxin into macrophages and certain other cell types in the spleen and liver results in toxin-induced inflammation, tissue damage and organ failure.

Role of the Mannose Receptor (CD206) in Innate Immunity to

The mannose receptor (MR) recognizes a range of carbohydrates present on the surface and cell walls of micro-organisms. The MR is primarily expressed on macrophages and dendritic cells and is involved in MR-mediated endocytosis and phagocytosis. In addition, the MR plays a key role in host defense ...

Mannose. Mannose is a component of oligosaccharides, which contribute to the establishment of nonpathogenic intestinal flora, and play a major role in intestinal health for both term and preterm infants.⁸⁹

MBL plays an important role in defending the body against invading microorganisms, including yeasts, parasites, viruses and some types of bacteria. 3,4,5 MBL is produced by the liver and
